

Check file and directory details

In the **Manage authorization** lab, check the permissions set for files and subdirectories in the **projects** directory. Make sure you display all permissions, including hidden files. Or, use the content of “Current file permissions” document to determine the current permissions.

Describe the command you can use to check permissions in the **Check file and directory details** section of the **File permissions in Linux** template. From the lab, take a screenshot of the Linux command you used. Or, type this command directly into the template.

Then, use either the output of this command in the lab or the content of the **Current file permissions** document to indicate the current permissions. If using the **Current file permissions** document, write these in the 10-character string that would be part of the command's output.

Describe the permissions string

Choose one example from the output in the previous step. In the **Describe the permissions** string section of the **File permissions in Linux** template, write a short description that explains the 10-character string in the example. You should describe what the 10-character string is for and what each character represents.

Change file permissions

The organization does not allow others to have write access to any files. Based on the permissions established in Step 3, identify which file needs to have its permissions modified. Use a Linux command to modify these permissions.

Describe the command you used and its output in the **Change file permissions** section of the **File permissions in Linux** template. In the **Manage authorization** lab, take a screenshot of the Linux command you used. Or, type this command directly into the template.

Change file permissions on a hidden file

The research team has archived **.project_x.txt**, which is why it's a hidden file. This file should not have write permissions for anyone, but the user and group should be able to

read the file. Use a Linux command to assign **.project_x.txt** the appropriate authorization.

Describe the command you used and its output in the Change file permissions on a hidden file section of the File permissions in Linux template. In the **Manage authorization** lab, take a screenshot of the Linux command you used. Or, type this command directly into the template.

Change directory permissions

The files and directories in the projects directory belong to the **researcher2** user. Only **researcher2** should be allowed to access the **drafts** directory and its contents. Use a Linux command to modify the permissions accordingly.

Describe the command you used and its output in the **Change directory permissions** section of the **File permissions in Linux** template. In the **Manage authorization** lab, take a screenshot of the Linux command you used. Or, type this command directly into the template.
