

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	The company experienced a security event where network services were disrupted for two hours, due to a distributed denial-of-service (DDoS) attack involving a flood of ICMP packets. The incident management team responded by blocking incoming ICMP traffic and stopping all non-critical services to restore critical operations. After investigation, the cybersecurity team determined the attack caused by a malicious actor exploiting an unconfigured firewall.
Identify	A malicious actor targeted the company with an ICMP flood attack. The entire internal network was affected, disrupting critical network services. All critical network resources needed to be secured and restored to normal operation.
Protect	The network security team implemented a new firewall rule to limit the rate of incoming ICMP packets and an IDS/IPS system to filter out ICMP traffic based on suspicious characteristics.
Detect	The network security team configured source IP address verification on the firewall to detect spoofed IP addresses on incoming ICMP packets, and network monitoring software to identify suspicious traffic patterns.
Respond	For future security events, the team needs to isolate the affected systems to

	prevent disruption and bring them back to normal operation. They need to analyze logs to identify suspicious activity. They also might report incidents to upper management and relevant authorities.
Recover	To recover from DDoS attack by ICMP flooding, the access to critical network services need to be restored to normal operation. The firewall will be used to block external ICMP flood attacks, followed by stopping all non-critical network services to reduce internal network traffic. After that, critical network services should be restored. When the flood of ICMP packets stopped, non-critical network services could be back online.
